# 1. Evidence-Based Compliance Framework

## Core Principle of RISQ 3.2

The core rule of RISQ 3.2 is Evidence-Based Compliance: the physical reality of the galley must mirror the Safety Management System (SMS) documentation flawlessly.

# RISQ 3.2 Compliance Standards

| Focus Area           | RISQ 3.2 Standard                        | Operational Target                                                            |
|----------------------|------------------------------------------|-------------------------------------------------------------------------------|
| Documentation        | Logs must match daily operations         | Zero discrepancies between signed logs and actual galley conditions           |
| Sanitation & Storage | Strict temperature logs; 12-inch rule    | No cardboard in cold stores (prevents pests/mold); consistent temp monitoring |
| Human Factors        | Training in welfare and company policies | Documented training on hygiene, mental health, and zero-tolerance harassment  |
| Maintenance          | All equipment fully functional           | Immediate reporting and repair of gear impacting food safety or nutrition     |

## 2. Vessel Takeover: Strategic Priorities

Transitioning a vessel to a new management system is a high-stakes period where compliance gaps often emerge. The key to navigating this successfully is to treat the first 30 days not just as an operational handover, but as an active pre-inspection window.

1

### Execute a Gap Analysis

Don't assume the new SMS matches the old one. Immediately compare the outgoing company's standards against your new requirements. Flag and bridge differences in food ordering, inventory, and log-keeping before legacy habits become liabilities.

2

### Audit to the Standard

Move beyond internal checklists. Audit your refrigeration, dry stores, and safety gear directly against the RISQ 3.2 parameters. This ensures you are measuring yourself against the same benchmark an inspector will use.

3

### Align the Team

The Chief Cook and Messman must operate as a unified front. Consistent communication ensures that every task—from cleaning to inventory—is executed and, crucially, recorded correctly in the SMS.

4

### Anchor to MLC 2006

Familiarize the entire team with MLC Regulation 3.2. RightShip inspectors rely on this global standard for food and catering to evaluate the overall quality of life on board.

The Bottom Line: Documented consistency is the hallmark of a successful audit. If an inspector walks into a clean, well-managed

### 3. The 30-Day Operational Checklist

Consistency is your strongest defense during a takeover. Use this framework to ensure your physical operations and documentation remain in lockstep.

# Daily Routine: The "Zero-Tolerance" Standard

These tasks are the foundation of your daily operations. They must be performed and logged every day.

## Temperature Logging

Record temperatures for all fridge and freezer units at the specific times mandated by your SMS.

## The "12-Inch Rule"

Visually inspect all dry stores and cold rooms; ensure no food or provisions are ever touching the deck.

## Cardboard Purge

Remove all cardboard from cold stores and freezers. Decanting items is essential to prevent moisture, mold, and pest ingress.

## Equipment Functionality

Test all cooking and sanitation gear. If something is underperforming, report it to the Chief Engineer immediately and file a formal defect report.

## Sanitation Sign-Off

The Chief Cook must personally verify the Messman's cleaning work before signing off. Never pre-sign or backdate these records.

# Weekly Audits: Maintenance & Verification

Use these deep-dives to catch non-conformities before they grow.

## Log vs. Reality

Pick one day from the previous week and verify it against the physical state of the galley. If the log says the grease traps were cleaned, pull them down and confirm.

## Inventory Rotation (FIFO)

Ensure the First-In, First-Out rule is applied across all stores. Remove any expired products immediately.

## Team Alignment Briefing

Hold a short, minuted meeting with the Messman to review sanitation standards, upcoming menu adjustments, and food safety policies.

## Pest Control Sweep

Inspect hidden corners, behind equipment, and under bulkheads for signs of pests. Document the inspection in your logs.

# 4. The 30-Day Transition Roadmap

## Week 1: Baseline & Documentation

### Compare Checklists

Map out exactly where the new SMS differs from your current practices.

### Establish the Standard

Perform a "Day 1" deep clean to set a high, non-negotiable benchmark.

### Locate MLC 2006 Data

Keep the ship's cook certificate and relevant MLC 3.2 documentation readily available for the inspector.

# Week 2: Training & Human Factors

## Policy Review

Document training sessions on the company's zero-tolerance policy regarding bullying and harassment.

## Hygiene Refresher

Review personal hygiene, uniform standards, and hand-washing protocols with the team.

## Nutritional Review

Confirm that the menu cycle meets the new SMS requirements for cultural and nutritional diversity.

## Week 3: Deep Maintenance

### Messroom Audit

Check all seating and serving equipment for cleanliness and repair.

### Exhaust System Clean

Ensure extraction fans, filters, and ducting are fully degreased and clean.

### Work Order Follow-up

Escalate any unresolved food-safety equipment repairs to the Master.

# Week 4: The Mock Inspection

## Full Walkthrough

Ask the Chief Officer or Master to conduct a formal inspection using the RISQ 3.2 criteria.

## Interview Prep

Practice responding to common questions, such as temperature requirements or the location of the garbage management plan.

## Final Polish

Audit your logs, training matrices, and cleaning schedules for the last 30 days to ensure they are complete, signed, and organized.
